## GRAFTED NETWORK INCORPORATING A MULTIPLE CHANNEL FLUID FLOW CONNECTOR

## Abstract

5 A grafted network including one or more graft segments use in coronary bypass procedures and which are configured to operably transport bypass blood flow from a singular supply location to one or more delivery locations in the grafted network is provided in combination with one or more multiple channel blood flow connectors for directing 10 such bypass blood flow in the grafted network to one or more vascular members requiring restorative blood flow thereto. The grafted network also preferably includes one or more devices for operably maintaining the grafted network under 15 relatively high internal fluid pressure continuously supply selective vascular members with adequate bypass blood flow.
